Tips for maintaining sand filled artificial grass tennis courts

The performance, longevity, and safety of a sand-filled artificial grass tennis court are largely determined by the level of maintenance it receives. We recommend the following DIY maintenance program, in addition to periodic professional servicing, to help keep courts operating at peak performance.

Recommended court owner maintenance

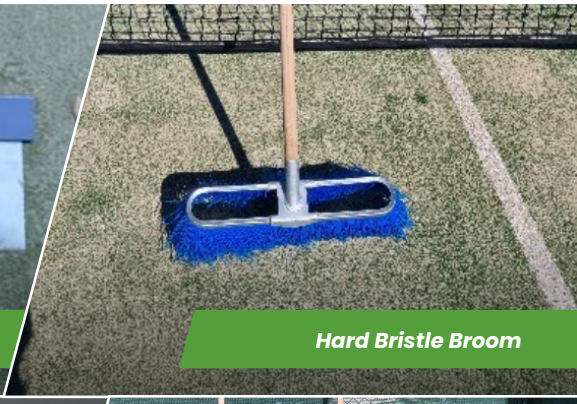
To be completed as often as necessary:

- Keep vegetation such as leaves and mower clippings off the surface by regularly raking it. This can be done most effectively with an Aussie Clean Sweep (ACS). Never with a blower. (Blowers move the sand infill around and make it uneven).
- Brush the pile up and redistribute the sand in high usage areas by using a Stiff Bristle Broom, Double Handled Broom, or an ACS.
- Where possible increase the amount of sunlight on the surface to help limit algae/ mould growth.
- Rotate court usage particularly at commercial venues to prevent high wear areas/courts.
- Keep water run-off from garden beds and watering systems off the court.
- When you see small patches of black (algae), or green (moss) appearing on your court, spray with Sports Cleans Synthetic Grass Treatment Concentrate and allow for growth to die
- Once dead, use a Tennis Court Scraper to remove it from the court, then sprinkle cooking salt over the area that you have just scraped and brush into the pile with a stiff bristle broom

Recommended Maintenance Tools

Aussie Clean Sweep

Court Surface Scraper



Hard Bristle Broom

Synthetic Grass Treatment

10KG Table Salt

Double-Handed Broom
